Profile

Graduated Software Engineer with **two years of production experience** as a full member of an empowered Scrum team at Schneider Electric, shipping features end to end on the **EcoStruxure Power** SaaS platform. Comfortable across **C# / .NET**, Java, React, Angular and TypeScript, with hands-on work on **REST / gRPC integrations**, SQL and NoSQL data stores, CI/CD, and micro-frontend architectures. Curious about how things work end to end, I care deeply about clean, maintainable code and enjoy shipping features that users actually feel.

Work experience

01/2024 – 01/2026
Kolding, Denmark

Software Developer (Intern & Student Assistant) Schneider Electric, Digital Energy (EcoStruxure Power)

- Full member of an **empowered Scrum team** inside a global release train of distributed teams across **Europe, North America and Asia**, collaborating daily with TPOs, Scrum Masters, architects, UX designers and stakeholders across multiple time zones.
- Took **end-to-end ownership** of tasks from the backlog: requirements refinement, design, implementation, **unit tests**, peer code review (given and received), and CI/CD deployment through Jenkins and GitHub Actions. Used **GitHub Copilot** in daily work.

Project 1 (2024): Java / Spring Boot · TypeScript · Angular · Storybook

- Shipped custom **UI components** for data-heavy tables: rich tooltips rendering multi-row, multi-column data on hover, and a custom cell-renderer that visualised state changes inside a single cell. Focus on clean visual hierarchy and accessible interaction.
- Delivered a **full-stack feature** (my largest for the project): I defined the REST endpoint, wrote the database query layer, integrated it from the Angular frontend, processed the data and rendered it in a new table view.

Project 2 (2025): C# / .NET · TypeScript · React · micro-frontends

- Translated layouts from a shared in-house **design system** into reusable React components inside a **micro-frontend architecture**, with independent component repositories composed by a shell app and published as versioned packages.
- Designed and integrated a custom **date-range picker** on top of a third-party library, adapting its look and feel to match the design system. A focused piece of **third-party integration** work.
- Ramped up fast on the new .NET and React stack and became one of the go-to people for teammates onboarding onto the same tooling.

Cross-cutting: Kafka Streams event-driven flows, microservice architecture, REST and gRPC integrations, SQL and NoSQL data stores, Azure, Docker, Kubernetes, Kibana for monitoring; supported live production systems through log analysis and coordinated bug fixing.

Tech & Tools: C#, .NET, Java, Spring Boot, React, Angular, TypeScript, JavaScript, HTML, CSS, Storybook, REST, gRPC, Kafka Streams, Docker, Kubernetes, Azure, Jenkins, GitHub

Education

08/2022 – 01/2026
Horsens, Denmark

Software Technology Engineering | Bachelor's Degree VIA University College

- **Backend & frameworks:** ASP.NET Core, Blazor (.NET), Spring Boot (Java), Entity Framework, JavaFX, React, Vue
- **Languages:** C#, Java, TypeScript, JavaScript, HTML, CSS, SQL (PostgreSQL)
- **Patterns & testing:** Clean Architecture, MVVM, MVC, Repository, Dependency Injection, unit testing (xUnit, JUnit)
- **Communication protocols:** REST API, gRPC, Socket TCP, RMI, message/event-driven patterns
- **Cloud & tooling:** Azure, Docker, GitHub, Bitbucket, Azure DevOps, Jira, Slack
- **Methodologies:** SCRUM, Waterfall

Project

Niteshift, blockchain incremental game (team of 3, 2024–present)

A Unity / C# game on the **Hydragon blockchain** where players spawn on a plot, build a tiered resource economy (mining drills, tier-1 to tier-3 assemblers, scavenger stations linked by streets) and buy more plots to win NFT rewards tradable on the in-game marketplace. I own the **entire Unity / C# frontend**: UI, HUD, assets, materials, every in-game user interaction, and an **auto-connecting building-and-street tile system** that detects neighbouring tiles and renders the right variant (straight, curve, T-junction, intersection) as the player builds or removes pieces. Built daily with **Claude Code** using custom skills and MCP server integrations as the agentic dev tool. A teammate owns the smart-contract backend on Hydragon.

Strengths

Clean code # Ownership # Problem solving # Curious # Teamwork # Adaptable
Eager to learn
