

Alexandro Bolfa

FULL-STACK SOFTWARE ENGINEER

Horsens, Denmark contact@alexandro-bolfa.com alexandro-bolfa.com
github.com/Reblayzer linkedin.com/in/alexandro-bolfa

PROFILE

Full-stack software engineer with two years shipping production features at Schneider Electric on the EcoStruxure Power SaaS platform, owning work from the REST endpoint and database query layer up to the view on top. B.Sc. in Software Technology Engineering from VIA University College, January 2026.

I build software that holds up end to end: clean APIs, sound data models, and interfaces that feel good to use. LLM-guided development is part of how I work, with GitHub Copilot daily at Schneider and Claude Code plus custom skills and MCP servers on personal projects.

Currently studying Danish (DU3 Module 3) and motivated to reach professional fluency.

SKILLS

Languages	Python, TypeScript, JavaScript, Java, C#, Go, SQL
Frontend	React, Next.js, Angular, Tailwind CSS, HTML & CSS
Backend & Data	.NET / ASP.NET Core, Spring Boot, FastAPI, Node.js, REST, PostgreSQL, Elasticsearch, Kafka
Cloud & DevOps	Azure, Docker, Kubernetes, Terraform, GitHub Actions, CI/CD, Linux
AI & Practices	Claude Code, GitHub Copilot, MCP, Microservices, Clean Architecture, Unit testing, Scrum, Git

EXPERIENCE

Software Developer (Intern & Student Assistant), Schneider Electric, Digital Energy Jan 2024 – Jan 2026
Kolding, Denmark

- Shipped features end to end on the EcoStruxure Power SaaS platform as a member of an empowered Scrum team inside a global release train of eight distributed teams across Europe, North America and Asia (around 60 engineers).
- Delivered a full-stack feature owning the REST endpoint, the database query layer, and the Angular view: a new tab listing generated scheduled reports for UPS assets, with custom data-heavy table components and cell renderers.
- Ramped fast onto a second international release on a C#/.NET and React micro-frontend architecture, integrating a custom date-range picker into the in-house Quartz design system and becoming a reference person for teammates joining the same stack.
- Owned tasks through refinement, implementation, unit tests (xUnit, JUnit), code review, and CI/CD (Jenkins, GitHub Actions); worked with Kafka Streams, gRPC, SQL and NoSQL stores, and Azure, with GitHub Copilot in every coding session.

PROJECTS

Consentinel github.com/Reblayzer/consentinel

Full-stack data-governance and compliance portal, built solo end to end. Owners register dataset manifests, an API auto-classifies every column for personal data, and data subjects file right-to-be-forgotten requests through a stewarded approval workflow with an append-only audit trail. The dependency-free PII classifier combines value patterns with multilingual column-name hints, including the Danish CPR format.

Python · FastAPI · PostgreSQL · Next.js · TypeScript · Terraform · Docker

Niteshift

Blockchain incremental game, built with two collaborators over a year and counting. I own the entire Unity and C# frontend: gameplay UI, HUD, the asset pipeline, and a building-and-street auto-connection system that detects neighbouring tiles, picks the right road variant, and rerenders dynamically as the player builds. Developed with Claude Code, custom skills, and MCP integrations.

Unity · C# · Game state management

Focus areas: Backend, Data Engineering, AI/LLM, Cloud/DevOps, Frontend. [See the full project explorer.](#)

EDUCATION

B.Sc. Software Technology Engineering, VIA University College 2022 – 2026

Horsens, Denmark. Bachelor's project: Storage Connector, a cross-platform .NET app unifying OneDrive and Google Drive with OAuth, async sync, and rate-limit handling.
